2020-02-04 René H. Gifford This updated second edition of Cochlear Implant Patient Assessment, Evaluation of Candidacy, Performance, and Outcomes, Second Edition is an instrumental reference for clinicians working with cochlear implant recipients and graduate students in the fields of speech-language pathology and audiology. The content of the text is logically organized, and begins with necessary background information for cochlear implant candidacy and the selection process. Later chapters provide information on assessment of implant candidacy, postoperative assessment of performance over the long term, and possibilities for future research and understanding. Though Cochlear Implant Patient Assessment, Second Edition contains useful information for even the most seasoned clinicians, it will serve an especially

important role in the education and training of students and clinicians being introduced to cochlear implant clinical practice. Having an experienced audiologist and speech-language pathologist authoring this work unites the inter-disciplinary nature of this practice. New to the Second Edition: \* Up-to-date research guiding candidacy and outcomes assessment—particularly relevant for cases of hearing preservation, determining bilateral CI candidacy, bimodal hearing, and assessment of the nontraditional cochlear implant candidate \* Assessment of candidacy and postoperative outcomes for individuals with unilateral deafness \* Assessment of non-English-speaking patients \* Role of imaging in device selection and postoperative assessment Disclaimer: Please note that ancillary content (such as documents, audio, and video, etc.) may not be included as published in the original print version of this book.

2011-01-01 Christoph Helmstaedter, Bruce Hermann, Maryse Lassonde, Philippe Kahane, Alexis Arzimanoglou Having appeared in the 1930s in Montreal, standardised neuropsychological evaluation has become an essential tool in the clinical diagnosis and evaluation of surgical epileptic patients. Nevertheless, despite great progress over the last 20 to 30 years in the diagnosis and medical treatment of epilepsy, clinical neuropsychology still remains largely associated with surgical epilepsy, particularly surgery of the temporal lobe. Clinical neurology has still not managed to clear a way in the daily practice with patients with all types of epilepsy despite significant advances in cognitive neuroscience and a large number of clinical studies on epilepsy and cognition. How is it that there are only rarely major advances in the field of clinical neuropsychology? It has long been time for this question to be asked, and for an attempt to be made to bring about changes. This was the aim of the Toronto workshop and the result of this book. Every approach was debated, providing important elements to reflect on and allowing a great forum for exchanges. This book includes the communications from the

main participants and comments from some others on specific subjects.

2013-06-29 Glen P. Aylward The practice of primary health care has expanded beyond the "traditional" medical model. Primary-care physicians and allied professionals are called upon more frequently to address parental concerns about developmental delays, poor school performance, or behavioral problems. As a result, pediatricians, family practitioners, pediatric nurses, social workers, and speech-language specialists are faced with the issue of developmental and psychological testing. The degree of the clinician's involvement in testing varies from interpretation of reports to performing screening or assessments. In many cases, the primary health care professional assumes the role of case manager. Unfortunately, cooperation between disciplines often has been limited because of poor communication, particularly in regard to developmental and psychological testing, where acronyms, statistics, and jargon abound. Even professionals from mental health disciplines such as child psychiatrists or psychiatric social workers sometimes are overwhelmed. The purpose of this book, therefore, is to provide the clinician with practical information regarding developmental and psychological testing, thereby making the health care professional an "educated consumer." This text does not simply describe how psychologists perform testing; rather, it provides information to help clinicians understand what the tests contain, what their strengths and limitations are, and how they can be incorporated into practice.

2013-06-29 Ronald H. Rozensky For two decades, I have been responding to questions about the nature of health psychology and how it differs from medical psychology, behavioral medicine, and clinical psychology. From the beginning, I have taken the position that any application of psychological theory or practice to problems and issues of the health system is health psychology. I have repeatedly used an

analogy to Newell and Simon's "General Problem Solver" program of the late 1950s and early 1960s, which had two major functional parts, in addition to the "executive" component. One was the "problem-solving core" (the procedural competence); the other was the representation of the "problem environment." In the analogy, the concepts, knowledge, and techniques of psychology constitute the core competence; the health system in all its complexity is the problem environment. A health psychologist is one whose basic competence in psychology is augmented by a working knowledge of some aspect of the health system. Quite apparently, there are functionally distinct aspects of health psychology to the degree that there are meaningful subdivisions in psychological competence and significantly different microenvironments within the health system. I hesitate to refer to them as areas of specialization, as the man who gave health psychology its formal definition, Joseph Matarazzo, has said that there are no specialties in psychology (cited in the editors' preface to this book).

2016-07-27 Laurie S. Eisenberg A comprehensive volume written by leading researchers, clinicians, and educators in the field, *Clinical Management of Children With Cochlear Implants, Second Edition* offers a guide for practitioners, instructors, and students. The book builds on over thirty-five years of collective experience in pediatric cochlear implantation and addresses contemporary practices. The authors share their expertise in such disciplines as otolaryngology, pediatrics, audiology, speech-language pathology, habilitation, education, electrophysiology, psychology, and clinical research. Although many of the chapters from the first edition remain relevant today, the field continues to evolve with advancements in technology, expanding indications, and patient demographics. The second edition reflects these changes with new topics and expanded updates, presenting up-to-date research findings with implications for clinical management of the pediatric implant population. New to this edition: New chapters on neurocognitive assessment, dual language learning, early literacy, family-centered habilitation, and development of evidence-based programs Expanded chapters on device programming, education, and auditory brainstem implants Updates in research and clinical practices in assessment and management

2006-04-18 Graeme Clark The cochlear implant is a device that bypasses a nonfunctional inner ear and stimulates the auditory nerve directly. Written by the "father" of the multi-electrode implant, this comprehensive text and reference gives an account of the principles underlying cochlear implants and their clinical application. For the clinician, the book will provide guidance in the treatment of patients; for the engineer and researcher it will provide the background for further research; and for the student, it will provide a thorough understanding of the subject.

2015-10-15 Henriette W. Langdon *Working with Interpreters and Translators: A Guide for Speech-Language Pathologists and Audiologists* offers state-of-the-art procedures to conduct interviews, assessments, and conferences with students with limited English language proficiency and their families. As no research base is available in the field of communicative disorders on this specific topic, the information presented in this guide is supported by a critical review of the literature on best practices in interpreting for international conferences and legal and medical fields. Furthermore, the authors' experience working with language interpreters and training professionals as well as graduate students in communicative disorders, makes this a very valuable resource for professionals, interpreters/translators, as well as undergraduate and graduate students. Federal and state laws specify that, if necessary, English-language learners (ELL) need to be assessed in their native language when referred for possible special education. The number of ELL students attending public schools across the nation has increased in the past few decades. There are not enough speech-language pathologists (SLPs) or audiologists who are proficient in the various languages spoken by ELL students—even in Spanish, the most common language spoken by ELL students in the United States. The next

best solution is to conduct assessments in collaboration with a trained interpreter/translator. Key features include: \* Information and references for the most common languages spoken by ELL students \* Discussion of culturally based variables that need to be considered in the process of interviewing and working with linguistically and culturally diverse populations \*Description of the roles and responsibilities for individuals who will be collaborating as interpreters and translators with SLPs and audiologists in various contexts, such as interviews, assessments, and various meetings (such as IEPs and IFSPs), as well as suggestions on training individuals in this collaborative process \*Review of best practices in speech-language and audiological assessments, both with and without materials in the given language Disclaimer: Please note that ancillary content (such documents, audio, and video) may not be included as published in the original print version of this book. Working with Interpreters and Translators: A Guide for Speech-Language Pathologists and Audiologists is a must-have reference for anyone working with ELL students. Although the process was developed with the pediatric population in mind, much of this information can be applied to older culturally and linguistically diverse populations in need of speech-language and/or hearing services. It will also be useful to professionals working with language interpreters in allied health professions in other countries.

2021 Tobias Haug "The identification of language problems and subsequent evaluation of interventions depend in part on the availability of useful and psychometrically robust assessments to determine the nature and severity of their problems and monitor progress. The purpose of these assessments may be to measure a child's language proficiency, that is, how they perform relative to other children and whether they have the language level expected and needed for schooling, or they may have a specifically clinical purpose, to identify the occurrence and nature of a disorder. The purpose of assessment is key to the aspects of language targeted in an assessment and the methods used to target these. In the case of spoken English, there are many language assessments ranging from broad language tests to more narrowly focused measures, reflecting the complexity of the language system and its use"--

1997 Catherine E. Renfrew This test assesses, from short sentence answers to specified questions, the age levels of the information content and grammatical usage. It is suitable for the age range of 3 to 8 years. It contains 10 full-colour cards, photocopiable scoring form, and manual.
