2007 This full-color handbook is a quick-reference guide to all aspects of documentation for every nursing care situation. It covers current documentation systems and formats, including computerized documentation, and features scores of sample filled-in forms and in-text narrative notes illustrating everything from everyday occurrences to emergency situations. Coverage includes timesaving strategies for admission-to-discharge documentation in acute, outpatient, rehabilitation, long-term, and home care environments and special documentation practices for selected clinical specialties: critical care, emergency, perioperative, maternal-neonatal, and psychiatric. The book includes advice on legal safeguards, dangerous

abbreviations, and compliance with HIPAA guidelines and JCAHO requirements.

2005-11-09 Nina M. Silverstein, PhD What happens when a person with dementia is hospitalized? It is usually a fall, a hip fracture, a serious infection, or an acute exacerbation of congestive heart failure, diabetes, or another chronic medical condition that precipitates hospitalization, not the person's dementia. This book provides insights into the issues and gaps in quality of hospital care for patients with dementia. The book will help practitioners improve the experiences that patients with dementia encounter in acute care settings by offering actual case examples provided by managers of assisted living, emergency rooms, and community geriatric cases; by persons with dementia who live alone; and by other doctors and nurses who care for these patients. These case examples illustrate the challenges faced and suggest strategies for successful and appropriate treatment planning. This book will be useful for all hospital practitioners who encounter patients with dementia, from administrators, to nurses, social workers, physicians, gerontologists, and psychologists. 1974 Deane B. Taylor Professional nurses have long been identifying and interpreting clues related to the gathering of information from which such decisions could be consistently drawn. The organization, systematization, and clustering of such clues required an extensive search of what was meaningful to nurses in different clinical settings. The research staff who designed the project as a contract to fulfill some basic goals for collecting, disseminating and utilizing information data for patients' records, have spent 3 years refining an assessment tool with two major factors in mind. First, a guideline was needed to obtain the most accurate information possible about individual patients in the context of their families and the community. Second, an assessment tool was needed which was computer manageable in the sense that it could be adapted to an on-line system of computer input and retrieval which would supply significant information to multiple sources. Two major sets of assessment records have been developed from an exhaustive trial of forms in a variety of settings. Consultation has been obtained from resources country-wide to insure as broad a view as possible of the current efforts in the development of new record systems. Faculty, students and nursing service staff members in hospitals and community health agencies have participated in the trials of these forms in real situations.
